

CivicOS

The operating system for democratic participation.

Open civic infrastructure that keeps citizens and their governments connected **between** elections — not just at the ballot box.

Democracy is a five-year event. Governance is a daily one.

Citizens vote, governments form, and engagement fades until the next cycle. In between, the questions that matter most have no reliable answer:

| Has this petition received **a response**?

| Did my representative **address this issue**?

| Was that project ever **completed**?

| What happened to the commitment made **last March**?

Without visibility, accountability becomes reactive rather than continuous — and public trust erodes on both sides of the relationship.

Every tool solves one problem. None of them connect.

Petition sites

Collect signatures. No path to a response.

Gov portals

Publish outward. Rarely listen back.

Complaint lines

Receive requests. Go dark afterwards.

Open data

Release datasets. No civic workflow.

Election monitors

Active for weeks every few years.

THE REAL GAP

Citizens don't experience civic life as isolated services. An issue becomes a petition, which becomes a conversation with a representative, which becomes a public commitment that **should be measurable over time.**

OUR THESIS

What's missing is not another standalone platform. It's **shared civic infrastructure** — the layer every one of those tools should have been built on.

One continuous civic loop, end to end.

CivicOS closes the loop that every other platform leaves open — from the moment a citizen reports a problem to the moment an institution is held to what it promised.

COMPLEMENTS, NEVER REPLACES

API-first, designed to sit alongside existing government systems rather than rip them out.

LOCALLY OWNED

Every deployment keeps its own branding, governance, data, and policies.

COUNTRY-AGNOSTIC

Nigeria first. The architecture adapts to any electoral and administrative model.

Five roles. One shared system of record.

FOR CITIZENS

Report community issues with photos and location. Sign and create petitions. Answer public consultations. Follow representatives. Get real-time updates when something they care about moves.

FOR REPRESENTATIVES

A direct channel to constituents that isn't social media. Publish announcements, respond officially to issues, and build a visible public record of responsiveness.

FOR ORGANIZATIONS & NGOS

Take formal ownership of issues, run consultations, publish projects and progress, and raise transparently funded community campaigns.

FOR GOVERNMENT ADMINS

See what a community is actually saying, at volume, with AI triage — instead of reading ten thousand submissions by hand.

FOR MODERATORS

Content flags, audit logs, and platform-level review queues that keep public civic space usable.

THE COMPOUNDING ASSET

Every interaction adds to a structured, queryable public record of civic activity — the thing no petition site or portal accumulates, and the reason switching cost grows over time.

This is not a deck-stage idea. It's a running platform.

11

Live CivicAI endpoints

232

Commits since first build, June 2026

SHIPPED AND WORKING

Identity & JWT auth · Communities · Issue reporting with status lifecycle · Petitions with signature milestones · Representative profiles & official responses · Public consultations with outcomes · Organizations, projects & assignments · Real-time notifications over SSE · Search & discovery · Community funding with a donation ledger · Admin console · Moderation & audit log

BUILT LIKE INFRASTRUCTURE

Go 1.26 · PostgreSQL 16 · Redis · NATS · React 18 + TypeScript across a citizen app, an admin console, and a documentation site · Hand-written OpenAPI 3.0 specs served as live Swagger UI · CI gates on formatting and build across every service · Dependency injection throughout, UUID keys, UTC timestamps, structured error codes

CivicAI is not a chatbot. It's a decision-support layer.

An institution receiving 8,000 consultation responses cannot read them. CivicAI turns unstructured civic input into structured, actionable output — wired into the workflows that already exist.

Classify

Suggests category, severity and tags as a citizen types an issue report.

Summarize

Themes, sentiment, top asks and recommended actions across a whole thread.

Draft

Announcements, donor updates and completion reports in plain, accessible language.

Narrate & assess

Explains metrics in words; flags campaigns a human reviewer should open first.

WHY THIS SURVIVES CONTACT WITH GOVERNMENT

Every output is a **suggestion, never an action**. Nothing auto-publishes, auto-assigns, or auto-decides. Each generation is provenance-tagged with its model and timestamp, every risk signal must cite the evidence behind it and state the innocent explanation for the same fact, and the entire layer **fails open** — if the model is unavailable, the civic loop keeps running without it. That is the difference between AI a public institution can adopt and AI its legal team blocks.

Civic money, with a ledger citizens can audit.

Organizations raise for boreholes, clinics, flood relief and school repairs — against milestones, with spending disclosed in public.

APPEND-ONLY BY DESIGN

A settled donation is never edited. Corrections are new rows. The ledger is the only account of this money the platform will ever have — so it is built to be replay-safe and tamper-evident.

FUNDS NEVER HELD BY US

Payments settle directly to the organization's own payment-provider sub-account. CivicOS is the transparency layer, not the custodian — which materially changes the regulatory posture.

MILESTONES, UPDATES, DISCLOSURE

Campaigns publish a plan, report progress, and file spending records against it. AI drafts the donor update; a human publishes it.

Stated honestly: organizations own their payment sub-account, so reported spending is **disclosure**, not something the platform can independently verify. The product is designed around that limit — visible plans, visible updates, visible gaps — rather than pretending otherwise.

Three curves crossing at the same moment.

01 · TRUST

Public trust is at a generational low

Declining confidence in institutions is one of the defining challenges across democracies — and the deficit is measurable, which means improvement is too.

02 · MOBILE

Civic life is the last analog holdout

Banking, health and education went digital. Participation didn't. In high-growth democracies, mobile penetration now makes the leapfrog possible.

03 · AI

Scale finally became tractable

Reading ten thousand citizen submissions was economically impossible two years ago. It now costs cents — which turns mass participation from a burden into an asset.

Add 2–3 sourced statistics here for your target geography — trust index, mobile penetration, urban population growth

Every institution with a public is a customer.

Replace bracketed figures with sourced estimates — cite the source on the slide itself; investors will check

Free for citizens. Paid by the institutions they hold to account.

01 · INSTITUTIONAL SUBSCRIPTION

Per organization, per year — [\$ PRICE]

Local governments, agencies, universities and NGOs pay for their own branded deployment: consultations, projects, CivicAI, analytics and moderation. Tiered by population served.

02 · FUNDING PLATFORM FEE

[X] % of transparently raised funds

A usage-based line that scales with civic activity rather than seat count, and only earns when an organization successfully raises.

03 · DEPLOYMENT & INTEGRATION

One-off — [\$ RANGE]

Onboarding, data migration and integration with existing government systems. Services revenue that also creates switching cost.

04 · GRANTS & DEVELOPMENT FINANCE

Non-dilutive — [\$ TARGET]

Open civic infrastructure is directly fundable by democracy, governance and transparency programmes. Named targets: **[FUNDER 1, FUNDER 2]**.

Citizen access stays permanently free. Charging the public to petition its own government would break the product.

Point solutions vs. shared infrastructure.

	PETITION PLATFORMS	GOVERNMENT PORTALS	311 / COMPLAINT APPS	CIVICOS
Citizen raises an issue	✓	partial	✓	✓
Institution responds in public	—	partial	—	✓
Two-way consultation	—	—	—	✓
Commitments tracked over time	—	—	—	✓
Transparent civic funding	—	—	—	✓
AI at civic scale	—	—	—	✓
Open, API-first, locally owned	—	—	—	✓

The moat is the loop. A competitor can clone any single row. Reproducing the connected record — issue to response to commitment to outcome, accumulated across a community over years — requires the whole system and the time it took to fill it.

Where we are today.

Pilot communities live

Registered citizens

Issues reported · % resolved

Institutions in conversation

PROVEN WITHOUT A SINGLE USER

The platform is **built, documented and deployable today** — five services, three front-ends, full API documentation and CI. Capital goes to distribution and pilots, not to finding out whether the thing can be built.

FILL THESE IN BEFORE YOU PITCH

Pilot LOIs or MoUs · named institutions in conversation · any live community and its engagement numbers · advisor or government-relations names · grant applications submitted. If a pilot is signed, this becomes your strongest slide — move it before the market slide.

Five phases. Each one independently valuable.

Evolutionary, not revolutionary — every release is a complete product, deployable in production, not an unfinished step toward one.

Gate on all four, every phase: Does it solve a real civic problem? · Can communities deploy it today? · Does it strengthen trust? · Is it stable enough for organizations to rely upon?

Who is building this.

FOUNDER

[NAME] — [ROLE]

[One line: the credential that makes you the right person to build civic infrastructure — prior build, government relationship, years in the domain.]

TEAM MEMBER

[NAME] — [ROLE]

[Relevant background in one line.]

ADVISORS

[NAMES]

[Government, civil-society or govtech advisors — these carry unusual weight in this category.]

What the code already says about the team: a five-service platform with documented APIs, CI gates, an AI layer designed around human oversight, and a payments ledger built to be replay-safe — shipped in months. Execution risk on the build is largely retired.

Raising **[\$ AMOUNT]** to deploy what is already built.

[X] %

Pilot deployment & government relations

[X] %

Engineering — identity, trust layer, scale

[X] %

Community growth & civic partnerships

[X] %

Operations, compliance & runway

WHAT THIS BUYS — **[N]** MONTHS

[N] live pilot deployments · **[N]** paying institutions · **[N]** registered citizens · Phase 3 identity & trust layer shipped · first **[\$ ARR]** in recurring revenue

MILESTONES THAT DE-RISK THE NEXT ROUND

Signed institutional contracts · demonstrated citizen retention · a measurable improvement in one community's response rate — the metric this whole category has never been able to show

Technology should not replace democratic institutions.
It should strengthen them.

Just as digital infrastructure transformed how people move money, CivicOS is building the infrastructure that transforms how people participate.
